Hej Oliver,

I played a bit with your program. I am really impressed by the level you reached with that one.

Here are a couple of comments and things I observed. I would imagine maybe minor for you – and maybe also a bit subjective, but of course you are on limited time (and you asked to test ;). The only one that I think is a bit serious to me is the one in italic. It should have priority. Of course it might be easier to discuss them face to face at some point.

---

quick action panel
- the context pop up is difficult to read when hoovering over the buttons with brown font over black background (I am an old man)
- “processed curve data” pushbutton: for me the name is not intuitive. Can we maybe rename it? maybe "processed sieve data", to make it coherent with "raw sieve weightings" button just next to it? I mean the help is amazing and when I read it, I understood but I felt it could almost work without help if it was renamed.

Main Interface plot
- Controls submenu (plot): it cannot be resized when open, so cannot read or modify some of the submenus depending on the screen.
- Export Figure (from main toolbar): It is super nice with the different graph styles, but could we have the most classic one available by default with font in black and background (outside figure) white or transparent?
- Export Figure (from Controls submenu) - as svg : not working

plot hydraulic conductivity
- Clarify what the mean is on the plot (arithm? / geo). Would be nice to have both. arithmetic and geometric
- Maybe I have not found it but is there a way to resize or remove the K value written above each bar results?

plot histogram
- by default, I would have "weight %" or something similar as y label but not “frequency”
- Would it be possible to have the X axis of the histogram as the description of the particle size fraction instead of size in mm (e.g. fine sand, medium sand etc as in iso14688, see hydrosieve example). Furthermore If I export the data from this graph, I get the cumulative percent instead of the histogram data.

Results

On the overview of all indicators, I can see there are warnings for some of them. In the right detailed menu when I click on them, some are declared as " conditions met". Some others are "conditions NOT met". Shouldn't it be rejeted then? If I run the datafile I provided in the former hydrosieve, some are indeed rejected and not included in the average value. As hydrosieve is built and published on a paper, we should ideally reproduce the same results except if we can justify there is something wrong. Yesterday I also managed to get a report (today not working, see below), and in it some indicators were marked with errors and not valid. But still part of the average as far as I could see.

Statistics

- Maybe I did not find it but I miss a table recapitulating the data from "plot histogram" showing the weight in %, maybe as the particle size fraction as requested for the graph (it is fine if it is in export data from figure instead).
- Data quality assessment box : what is is based on?

Report

I managed to get the report out yesterday, but today not working. I simply do not know what I miss here (I tried generate, refresh etc)

Let me know if you want to discuss that. Assuming you have the time.

Greg
